EXECUTIVE SUMMARY

Christoffer is an Azure Architect and Terraform expert at Zure with close to a decade of hands-on Azure experience. He began his career as a classical infrastructure engineer and has since grown into a specialist in Azure architecture, Infrastructure-as-Code, and DevOps. He holds the AZ-305 Azure Solutions Architect Expert and AZ-400 DevOps Engineer Expert certifications, along with AZ-104, AZ-500, and HashiCorp Terraform Associate.

Through his work at Zure, Automize, and Netcompany, Christoffer has delivered Azure solutions for clients in financial services, insurance, and pensions, including Nykredit Mægler, Topdanmark, and Festina Finance. His experience spans datacenter migrations and application modernization, Microsoft CAF landing zones built with Terraform and Bicep, and Azure DevOps organizations designed from scratch with CI/CD pipelines, Git flows, and governance. At Topdanmark, he defined the Terraform standards and reusable modules used by more than 200 developers, and at Netcompany he built a PowerShell automation framework that eliminated thousands of hours of repetitive operations work each year across more than 200 Azure tenants.

Christoffer is a consultant first. He takes ownership of critical architectural decisions, runs workshops that help customers understand and adopt Azure, and invests in strengthening the teams around him. Curious and driven, he thrives on solving complex problems and working closely with customers to achieve shared goals.

CHRONOLOGY

Period	Employer	Role
February 2026 – Present	Zure	Azure Architect
November 2023 – February 2026	Automize	Azure Cloud Specialist | Terraform Expert
January 2023 – November 2023	Netcompany	Azure Cloud Specialist
February 2022 – January 2023	Netcompany	Operations Engineer

ASSIGNMENTS

February 2026 - Present

Client	Nykredit Mægler
Project	Datacenter migration & modernizing applications
Role	Azure Architect / DevOps engineer

Description

Since his start at Zure, Christoffer has been tasked with migrating the customer from an on-premises datacenter to Azure. As part of this move, an Azure cloud platform designed using the Microsoft Well-Architected Framework was defined first, after which the migration itself was split into two sections:

Lift-and-shift migration of legacy technology that could not be modernized: Moving data to Azure, then creating traditional virtual machines to host the applications.

Modernization / re-architecting of their most important applications: Moving from virtual machines to Azure PaaS services, designing and building the system anew by leveraging modern Azure technologies to make the solution viable for many years to come.

As part of the project, everything is built via Infrastructure-as-Code, and all processes and governance surrounding the project adhere to agile workflows, leveraging Azure DevOps for backlog management, sprint planning, and CI/CD pipelines that ensure consistent, automated, and repeatable deployments across all environments.

November 2023 – February 2026

Client	Various clients (via Automize)
Project	Azure cloud projects of different sizes and technology stacks
Role	Azure Cloud Specialist | Terraform Expert

Description

During his last 2 years at Automize, Christoffer has achieved a multitude of achievements in projects of different sizes and technology stacks. He is a consultant first, so his finest task is to always make sure he helps the customer with their cloud needs, which span wide:

1. **Designed, led, and developed multiple Azure CAF landing zone platform projects** using Terraform and Bicep as Infrastructure as Code (IaC) tools.
2. **Delivered in-depth customer workshops on complex Azure topics**, focusing on teaching technology concepts, leveraging Microsoft CAF assessments, and guiding customers through Azure decision-making. Additionally, conducted workshops where project handovers occurred to ensure smooth transitions.
3. **Took responsibility** not only for the technical implementation of solutions but also for making critical architectural decisions at complex technical crossroads in projects.

4. **Focused on strengthening the internal team** by fostering both technical understanding and continuous learning. Additionally, prioritized building efficient and well-functioning partnerships with colleagues, as he firmly believes that 'two minds think better than one.'
5. **Designed, configured, led and maintained multiple Azure DevOps organizations** from scratch. Defining everything from CI/CD pipelines, automation scripts, pull request Git flow, Git policies and helping the customer understand the DevOps way of working.

June 2023 – November 2023

Client	Topdanmark (via Netcompany)
Project	Migration and transition of an on-premises pension solution to Azure
Role	Azure Cloud Specialist | Terraform Expert

Description

Shortly after successfully completing the Festina project, Christoffer was once again assigned to another customer, Topdanmark, an insurance company that had sold its pension system to another bank. Netcompany was engaged as a partner to facilitate the migration and transition of an on-premises solution to Azure.

In his role, he defined Terraform coding standards and created reusable modules, providing support to over 200 application developers in the creation and use of standardized code for deploying Azure resources. Leveraging his over 7 years of Azure administrator experience, he not only managed deployments but also configured governance, security, specific Azure components, networking, automation, and various other aspects. On the technical front, he served as a technical lead, advocating for the chosen technologies and tools throughout the development cycle. He provided support to projects, guiding them in the efficient and secure utilization of these tools to create concise, securely connected, and maintainable resources in the Azure tenant and various subsets of Azure landing zones (Microsoft CAF).

January 2023 – June 2023

Client	Festina Finance (via Netcompany)
Project	Migration of a transaction-heavy workload to Azure and a new Azure DevOps platform
Role	Azure Cloud Specialist | Terraform Expert

Description

After several months as an Operations Engineer, Christoffer was asked to support an external project for Festina Finance. The project involved migrating a transaction-heavy workload to Azure, establishing a new Azure DevOps platform, and implementing the entire platform's resources in Terraform using CI/CD.

During the project, he was responsible for defining all Terraform- and pipeline-related code (YAML) and establishing coding standards. He also provided training and guidance to team members and the customer on their new Azure DevOps platform. The project was managed using two-week sprints, where the team worked through the backlog and resolved issues related to the implementation and adoption of Azure.

February 2022 – January 2023

Client	Netcompany (internal)
Project	Cloud Infrastructure team – internal Azure tenants and automation
Role	Operations Engineer

Description

Christoffer was a member of the Cloud Infrastructure team, comprising an 8-person team, responsible for overseeing all internal Azure tenants (200+) and subscriptions (300+). His role involved managing governance, security, operations, and development aspects.

After three months, he initiated the development of an Automation Framework in PowerShell, effectively addressing a significant challenge that had previously consumed thousands of hours annually on repetitive tasks. This framework drastically reduced the time required to complete all the team's operations tasks.

He designed, configured, and managed a comprehensive Azure DevOps organization utilized by the internal team. This included designing Git flows, CI/CD processes, and implementing testing and quality assurance measures. He continued to enhance automation solutions and further developed his skills in DevOps. He designed, configured, and managed a framework built with PowerShell and Terraform for the automated deployment of necessary resources using automation, Infrastructure as Code (IaC), and Azure DevOps pipelines (October 2021 – February 2022). This solution completely standardized the process of preparing new tenants, subscriptions, management groups, and other types of resources related to governance, security, and operations.

EDUCATION

Data technician specializing in infrastructure, Technical Educational College (TEC) 2016–2021

Gymnasium (HTX, Higher technical education), Hilleroed 2010–2014

CERTIFICATIONS

- AZ-104 (Azure Administrator)
- AZ-500 (Azure Security)
- AZ-400 (DevOps / Expert)
- AZ-305 (Azure Architect / Expert)
- Terraform (Associate)
